

## Requirements

- Java 21+ (Java 21 was chosen to see how frameworks work with this version of Java.)
- Maven 3.9+
- Docker Compose

## Build and Run

To build and start the application in the chat directory:

```
docker compose up --build
```

After it we can go to the directory chat-api-test and run: `mvn clean test`.

Once running, access the API documentation via Swagger UI:

- <http://localhost:8080/swagger-ui/index.html>

## Stopping the Application

To stop and remove containers:

```
docker compose down
```

To stop containers and remove all associated data (including the database volume):

```
docker compose down -v
```

## Black box testing.

When chat application is running, we can run black box tests.

Go to the directory chat-api-test and run: `mvn clean test`.

Please take a look at the results in `target/surefire-reports/index.html`

## All information below just informative.

## Objective

This project demonstrates a practical strategy for integrating and using the AI assistant IntelliJ IDEA AI Chat (Junie) within a development workflow. The AI-related components are organized in the chat directory and exposed through a REST API interface. This project is in the directory **chat**.

Project Structure

- `.aiignore`  
Defines which directories should be excluded from AI assistant processing.
- `.junie/guidelines.md`  
Contains high-level project guidelines and instructions for working with the AI assistant.

- `prompts/applied-prompts/`  
Stores reusable prompts and related resources used by the AI assistant.

## Testing

The project includes both **unit tests** and **integration tests**, which can be executed independently. Refer to the instructions in `RUN_ME.md` for the exact commands.

## Additional information

In both projects there are `info/PRJ_DESCRIPTION.md` files with project description generated by Clause.
